7 Detailed Description

7.1 Overview

The TPS92511 is an easy to use constant current buck converter for driving a single LED string with current up to 0.5A and efficiency up to 95%. Only 5 external components are required for basic operation and single layer PCB layout is feasible because of the integration of a N-MOSFET, no external current sensing resistor, no external compensation and the proper pin assignment. A high-value external resistor programs the LED current so that fine tuning of the LED current can be achieved. Another high-value external resistor programs a constant switching frequency from 50kHz to 500kHz. As a result of constant switching frequency, EMI design becomes easy. The TPS92511 provides a wide input voltage range from 4.5V to 65V. By adding simple external circuits, it can handle applications with even higher input voltages.

The TPS92511 employs a proprietary Pulse-Level-Modulation (PLM) control scheme under continuous conduction mode (CCM) to regulate the LED current without the need of sensing the LED current directly. It applies a floating buck topology with a low-side N-channel power MOSFET, which does not need boot-strapping capacitor, so that driving LED string under drop-out conditions and very high input voltages are feasible. For multiple channel systems, the floating buck topology without external current sensing network together with the proprietary control scheme allows a common-anode connection of the LED strings without external current sensing network. This saves high-side current sensing wirings for separate driver boards and LED board systems and significantly reduces the number of wiring, which can lower overall manufacturing cost.

The TPS92511 has very fast PWM dimming response time. There is almost no delay between the DIM pin voltage rising edge and the start of the LED current conduction, so it can dim down to nearly zero current. In order to maintain good dimming linearity, the minimum LED current pulse width is suggested to be three switching cycles. For example, if the switching frequency is 500 kHz, the minimum DIM pulse width is 6µs and the dimming frequency is 150Hz, a contrast ratio of more than 1000:1 can be achieved.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Pulse Level Modulation (PLM) Control

A proprietary Pulse-Level-Modulation (PLM) control method is used in the TPS92511. It can regulate the average LED current by sensing only the inductor current at the on-period ([Figure](#page-9-1) 13). The integrated MOSFET and the sensing and control circuits in the TPS92511 implement the whole PLM control internally so the control does not suffer from tolerance and noise issues that may be coming from external components. As compared with the conventional method which regulates average LED current by sensing the current over the entire switching cycle, the power dissipation on the sensing circuit in PLM is much lower. For example, consider a duty cycle of 0.5, the power dissipation on current sensing in PLM can be reduced by half. PLM requires no external loop compensation circuit. Besides, the accuracy of the regulated LED current is high (typically $\pm 3.5\%$ in the TPS92511).

Figure 13. Waveforms of a Floating Buck LED Driver with PLM

7.3.2 Pulse Level Modulation (PLM) Operaion Principles

The Pulse-Level-Modulation is a patented method to ensure an accurate average output current regulation without the need of direct output current sensing. [Figure](#page-9-1) 13 shows the current waveforms of a typical buck converter under steady state, where, $I_{1,1}$ is the inductor current and $I_{1,x}$ is the current flowing into the LX pin. For a buck converter operating in steady state, the mid-point of the RAMP portion of I_{L1} equals to the average value of I_{L1} and hence the average LED current $I_{LED(avg)}$. In short, by regulating the mid-point with respect to a precise reference level, PLM achieves LED current regulation by sensing the main MOSFET current solely, instead of the entire cycle of I_{11} .

7.3.3 PLM Control enable Common-Anode Low-Side Sensing (CALS)Technique to Save Wiring

For multi-channel systems with separated driver boards and LED array boards, the Pulse-Level-Modulation (PLM) control scheme enable Common-Anode Low-Side Current Sensing to save inter-board wirings. [Figure](#page-10-0) 14 shows a conventional configuration with a Low-side switching and High-Side Current Sensing. For an n channel system with separated driver and an LED array boards, 2n inter-board wirings are required. For example, an 128-channel system needs 256 inter-board wirings, which implies a high material and manufacturing cost. [Figure](#page-10-1) 15 shows the PLM configuration with Low-side switching and Low-Side Current Sensing. A Common-Anode configuration is used for the LED array board. As shown in the figure, an n channel system with separated driver and LED array boards requires only n+1 inter-board wirings. For an 128-channel system, only 129 interboard wirings are required. The wiring cost is cut by half, and the cost of the end product can be reduced.

(2)

Feature Description (continued)

7.3.4 Internal Regulator

The TPS92511 integrates an internal voltage regulator for powering internal circuitry. For stability, an external capacitor C_{VCC} of at least 1 µF should be connected between the VCC and PGND pins The output of the internal regulator V_{CC} is 5.4V when V_{IN} is larger than 6V. If V_{IN} is lower than 6V, V_{CC} decreases. The TPS92511 will trigger the VCC under-voltage lock-out if V_{CC} falls below typically 3.5V. V_{CC} can be used to bias external circuits subject to a loading of maximum 2 mA, while it has a short circuit current limit at typically 16 mA.

7.3.5 Setting The Switching Frequency

The switching frequency f_{SW} of the TPS92511 is programmable in the range of 50 kHz to 500 kHz by a single resistor R_{FS} connecting the FS pin and ground. The following equation shows the relationship between f_{SW} and R_{FS} :

$$
f_{SW} = \frac{10 \times 10^6}{R_{FS}} \text{kHz}
$$

[Figure](#page-11-0) 16 plots f_{sw} against R_{FS}. [Table](#page-11-1) 1 shows values of R_{FS} for commonly used switching frequencies.

Figure 16. Switching Frequency vs R_{FS}

f_{SW} (kHz)	R_{FS} (kΩ)	
50	200	
100	100	
300	33.2	
500	20	

Table 1. Commonly Used f_{SW} And R_{FS}

7.3.6 Setting The LED Current

The LED current I_{LED} of the TPS92511 is programmable by a single resistor R_{IAD} connecting the IADJ pin and ground. The IADJ pin is internally biased to 1.25 V. [Equation](#page-11-2) 2 shows the relationship between I_{LED} and R_{IADJ} :

$$
I_{LED} = \frac{1500}{R_{IADJ}} A
$$

To ensure stability, R_{IADJ} must be less that 30 kΩ, implying a minimum I_{LED} of 50 mA can be programmed. The tolerance of I_{LED} of 150 mA is shown in the ELECTRICAL CHARACTERISTICS. Larger tolerance should be expected for lower I_{LED}. [Figure](#page-12-0) 17 plots I_{LED} against R_{IADJ}. [Table](#page-12-1) 2 shows values of R_{IADJ} for commonly used I_{LED}.

Figure 17. LED Current vs RIADJ

7.3.7 Integrated MOSFET

The TPS92511 integrates a N-channel power MOSFET, the drain of which is connected to the LX pin. When the integrated MOSFET is turned on, the resistance across the LX and GND pins is typically 1.4Ω. The integrated MOSFET has a fixed current limit of 1.2A to protect the application circuit during critical operation conditions like short circuit of the LED string. Once the limit is hit, the integrated MOSFET turns off immediately for 34 µs to let the inductor discharge.

The minimum on-time of the integrated MOSFET is 400 ns. It may be hit at a high switching frequency and a high V_{IN}/V_{LED} ratio. Once hit, the I_{LED} regulation may be affected. In the worst case, I_{LED} may be boost up to a level higher than the programmed value, and the LED string and/or the inductor may be damaged as a result. Hence, it is recommened that the ratio between V_{IN} and V_{LED} should be designed under the following constraint:

$$
\frac{V_{LED}}{V_{IN}} \ge 400 \text{ns} \times f_{SW} \tag{3}
$$

7.3.8 Inductor Selection

Operating in the continuous conduction mode (CCM) is required in the TPS92511 application circuit. In the CCM, considering the on-period, the peak-to-peak inductor current ripple $(2\Delta I_{11})$ is shown in [Equation](#page-12-2) 4.

$$
2\Delta I_{L1} = \frac{t_{on}(V_{IN} - V_{LED})}{L_1}
$$
\n(4)

Because

$$
\frac{V_{LED}}{V_{IN}} = t_{on} f_{SW}
$$
 (5)

L₁ can be a function of V_{IN}, V_{LED}, f_{SW} and $Δl_{L1}$ as shown in [Equation](#page-12-3) 6.

$$
L_1 = \frac{(V_{IN} - V_{LED})V_{LED}}{2\Delta I_{L1}V_{IN}f_{SW}}
$$
(6)

The value of L₁ is selected by designers with the consideration of all above parameters. The minimum L₁ calculated by the following equation is a good starting point for designing L_1 :

Copyright © 2014, Texas Instruments Incorporated *Submit [Documentation](http://www.go-dsp.com/forms/techdoc/doc_feedback.htm?litnum=SNVS901A&partnum=TPS92511) Feedback* 13

The following table shows some typical examples of using $R_{\sf FS}$ and $R_{\sf IADJ}$ to estimate the minimum ${\sf L}_1$:

R_{FS} (kΩ)	R_{IADJ} (kΩ)	Estimated Minimum L₁ (μH)	Recommended L_1 (μ H)
100	10	1000	1000
33.2	3.01	100	100
20	4.32	86	100
20	3.01	60	68

Table 3. Estimation Of Minimum L¹ Using RFS And RIADJ

To maintain the CCM, $Δl_{L1}$ must be smaller than the average LED current $l_{LED(avg}$. Hence, the minimum inductance used is:

$$
L_{1(min)} = \frac{(V_{IN} - V_{LED})V_{LED}}{2I_{LED(avg)}V_{IN}f_{SW}}
$$

In the absence of output capacitors, the TPS92511 can maintain a continuous I_{LED} throughout the entire switching cycle because in such case the inductor current is the same as ILED (floating buck topology operating in the CCM). However, the LED peak current must not exceed the rated current of the LED. The peak LED current can be found by the following equation:

$$
I_{LED (peak)} = I_{LED (avg)} + \frac{\left(V_{IN} - V_{LED}\right)V_{LED}}{2L_1V_{IN}f_{SW}}
$$

7.3.9 Integrated MOSFET Current Limit

The current limit of the integrated MOSFET is internally fixed at 1.2A to protect the LED string, the inductor and the integrated MOSFET from overdriven. Once triggered, the integrated MOSFET turns off immediately for 34 µs to let the inductor to discharge. The triggering of the current limit cycles repetitively until all overdriven conditions disappear.

7.3.10 PWM Dimming Control

The TPS92511 implements PWM dimming by applying a PWM dimming signal to the DIM pin. A low input applying to the DIM pin disables the switching of the integrated MOSFET, and as a result discharges the inductor and then turns off the LED string. To turn on the LED string, the DIM pin should be connected to high or left open (since it is internally pulled high by a current of typically 40 µA and 90 µA when the DIM pin is low and high respectively). The PWM dimming frequency is recommended to be lower than $0.1f_{SW}$ to ensure normal operation.

7.3.11 Analog Dimming

Analog dimming can be implemented by injecting a current to R_{IADJ} ([Figure](#page-14-0) 18) and as a result reduces the current of the IADJ pin, I_{ADJ} , which is controlled internally by the TPS92511 to bias the voltage on the IADJ pin to be 1.25V. If the CCM can be maintained, the minimum I_{ADJ} can achieve 15 µA, which refers to an I_{LED} of 18 mA. If I_{ADJ} is further decreased, I_{LED} may not follow due to the presence of the minimum on-time of the integrated MOSFET. If the CCM cannot be maintained, I_{LED} can still decrease monotonically with I_{ADJ} . However, if good line and load regulations are required, the CCM should be maintained by using a large inductance.

(7)

(8)

(9)

7.3.12 High Voltage Buck Configuration

The TPS92511 can handle applications with an input voltage higher than 65V, which is the maximum V_{IN} of the recommended operating condition of the TPS92511, by adding an external high voltage N-channel MOSFET to the application circuit as shown in [Figure](#page-14-1) 19. PWM dimming can be implemented in this circuit without additional efforts, and analog dimming is also feasible by referencing to additional circuits shown in [Figure](#page-14-0) 18.

[TPS92511](http://www.ti.com/product/tps92511?qgpn=tps92511) SNVS901A –MARCH 2014–REVISED MAY 2014 **www.ti.com**

7.3.13 Thermal Foldback

Thermal foldback is useful to prevent over-temperature of LEDs during operation by sensing the temperature of LEDs and, if the sensed temperature is high, reducing I_{LED} to decrease the power and as well as the temperature of LEDs. Thanks to the feature of analog dimming, thermal foldback can be implemented by embedding a negative temperature coefficient (NTC) resistor, R_{NTC} , into a circuit as shown in [Figure](#page-15-0) 20. When the sensed temperature increases, R_{NTC} decreases and thus the emitter current of Q_{T1} increases to reduce I_{LED} by means of analog dimming. The resistor R_{TF} can adjust the loop gain of the thermal foldback control loop, which should be high enough to avoid oscillation and maintain stability.

Figure 20. Circuit Configuration for Thermal Foldback

7.3.14 EMI Consideration

Conductive and radiative EMI can be major concerns for lighting applications. The TPS92511 application circuit can be designed for the EN 55022 class B standard by adding a few external components, as shown in [Figure](#page-15-1) 21. The input filter which consists of an inductor L_2 and two capacitors C_{1N2} and C_{1N3} takes care of the conductive EMI, while the output capacitor C_{LED} and the ferrite bead FB₁ which inserts between the LX pin and D_1 take care of the radiative EMI.

7.4.1 Operation with $V_{IN} < 4.5$ **V** (minimum V_{IN})

For the typical application circuit, when the input voltage drops so that the VCC voltage regulator is under dropout mode, and the VCC voltage drops below the "VCC UVLO Lower Threshold" (typically 3.48V), the switching of the main MOSFET is stopped, and the LED current will become zero. At the same time, the voltages of both the FS and IADJ pins will become zero .

When the input voltage increases from zero and the VCC voltage is increased to cross over the "VCC UVLO Upper Threshold" (typically 3.75V), the voltages on the FS and IADJ pins will rise to their regulation voltage (typically 1.25V), the switching of the main MOSFET is started upon the DIM pin voltage is HIGH, and the LED current will ramp up to its preset value set by R_{IADJ} .

7.4.2 Operation with DIM control

For the typical application circuit, when the VCC voltage is not under UVLO condition, the switching of the main MOSFET is enabled and the LED current is conducted if the DIM pin voltage is higher than the "DIM Pin Upper Threshold" (typically 1V).

Alternaltively, the switching is disabled and the LED current is cut off if the voltage of the DIM pin is lower than the "DIM Pin Lower Threshold" (typically 0.675V).

7.4.3 Linear Mode

When the VCC voltage is not under UVLO condition and the voltage on the FS pin is forced to be higher than 4.2V but lower than 5V, the switching of the main MOSFET is disabled, and the TPS92511 is working in the Linear Mode. In the Linear Mode, if the voltage on the DIM pin is higher than the "DIM Pin Upper Threshold" (typically 1V), the TPS92511 will regulate the LX pin in-going current according to the preset value set by R_{IADJ} . Alternatively, if the voltage on the DIM pin is lower than the "DIM Pin Lower Threshold" (typically 0.675V), the LX pin will open and its in-going current will become zero.

Below is the simple configuration to have the TPS92511 working as a linear current shunt regulator.

Figure 22. Circuit Configuration for Working as a Linear Current Shunt Regulator

8 Application and Implementation

8.1 Application Information

The TPS92511 is an LED driver which provides a regulated output current to drive a single string of LED with the forward voltage lower than the input voltage. The following procedures design a TPS92511 application circuit with an input voltage of 48V, driving an LED string of 38V at an LED current of 0.5A. The switching frequency is 300 kHz.

8.2 Typical Application

8.2.1 TPS92511 LED driver for 12 LEDs at 0.5A

Figure 23. Application Circuit of TPS92511 (f_{SW} = 300 kHz and I_{LED} = 0.5A)

Typical Application (continued)

Table 4. Design Parameters

8.2.1.2 Detailed Design Procedure

 C_{IN} : The function of the input capacitor C_{IN} is to reduce the input voltage ripple. Ceramic capacitors are recommended owing to the concern of product lifetime. A 100V 2.2 µF ceramic capacitor is selected in this circuit.

C_{VCC} : The capacitor on the VCC pin provides noise filtering and stabilizes the internal regulator. It also prevents false triggering of the VCC UVLO. C_{VCC} is recommended to be a 1 μ F good quality and low ESR ceramic capacitor.

 D_1 : The diode D_1 should have a reverse voltage larger than V_{IN} in the floating buck topology. In this circuit, a 100V diode is selected.

R_{FS} and R_{IADJ}: In this circuit, the switching frequency and LED current are designed to be 300 kHz and 0.5A. From [Table](#page-12-1) 1 and Table 2, R_{FS} is 33.2 kΩ and R_{IADJ} is 3.01 kΩ.

L1 : The selection of inductor mainly affects the inductor current ripple. In this circuit, we design the peak to peak inductor current ripple to be 50% of I_{LED}, i.e. 0.25A. From (6), L₁ is calculated to be 106 µH, and a 100 µH inductor is selected.

[TPS92511](http://www.ti.com/product/tps92511?qgpn=tps92511)

[TPS92511](http://www.ti.com/product/tps92511?qgpn=tps92511) SNVS901A –MARCH 2014–REVISED MAY 2014 **www.ti.com**

8.2.1.3 Application Curves

9 Power Supply Recommendation

This device is designed to operate from an input voltage supply range between 4.5 V and 65 V. The input supply should be well regulated. If the input supply is located more than a few inches from the TPS92511 application board, additional bulk capacitance may be required in addition to the input capacitor. A ceramic capacitor with a value of 2.2 μF is a typical choice.

[TPS92511](http://www.ti.com/product/tps92511?qgpn=tps92511) SNVS901A –MARCH 2014–REVISED MAY 2014 **www.ti.com**

10 Layout

10.1 Layout Guidelines

- The PCB layout of the TPS92511 application circuit plays an important role in optimizing the performance.
- The external components should be placed as close to the TPS92511 as possible to minimize resistance and parasitic inductance of copper traces.
- For example, D_1 and L_1 should be near the LX pin, and C_{VCC} should be near the VCC pin, and the connecting copper traces are short and thick.
- The exposed pad of the TPS92511, which is internally connected to the die substrate, should be connect to a ground plane, and the plane should be extended as much as possible on the same copper layer around the TPS92511.
- Using numerous vias beneath the exposed pad to dissipate heat to another copper layer is also a good practice.

10.2 Layout Example

Figure 32. TPS92511 Board Layout

10.2.1 Thermal Consideration

 Ψ_{JT} (shown in session 6.4 Thermal Information) is a relatively small value for package with exposed pad since most of the heat is dissipated through the exposed pad to the copper plate of the PCB (assuming optimized PCB layout), relatively little heat goes to the top of the device. The top of the device mold compound temperature is physically close to the device junction temperature.

For example, a 30W output TPS92511 end system at 95% power efficiency (can be estimated from the efficiency curves of Figure 13), power loss is 1.6W. Assuming all the heat is generated from the TPS92511 (which is true for high V_{LED}), and assuming half of the heat generated is dissipated through the top of the device. Now Ψ_{JT} is 11 °C/W, the device junction temperature is estimated to be higher than the package's top-surface temperature by 11 x 1.6 x 0.5 = 8.8 (°C). If the package top-surface temperature is measured to be 90 °C (for example by an IR camera), the device junction temperature is around 99 °C, which is within the 125°C maximum junction temperature requirement with margin.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures. "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

*All dimensions are nominal

PACKAGE OUTLINE

DDA0008A PowerPAD™ SOIC - 1.7 mm max height

PLASTIC SMALL OUTLINE

NOTES:

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

- 2. This drawing is subject to change without notice.
- 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MS-012.

EXAMPLE BOARD LAYOUT

DDA0008A PowerPAD™ SOIC - 1.7 mm max height

PLASTIC SMALL OUTLINE

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
- 8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
- Size of metal pad may vary due to creepage requirement.
- 10. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

DDA0008A PowerPAD™ SOIC - 1.7 mm max height

PLASTIC SMALL OUTLINE

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

12. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource.
